Single and Dual Low Voltage, Rail-to-Rail Input and Output, Operational Amplifiers

LMV931, LMV932

The LMV931 Single and LMV932 Dual are CMOS low−voltage operational amplifiers which can operate on single−sided power supplies (1.8 V to 5.0 V) with rail−to−rail input and output swing. Both devices come in small state−of−the−art packages and require very low quiescent current making them ideal for battery−operated, portable applications such as notebook computers and hand−held instruments. Rail−to−Rail operation provides improved signal−to−noise performance plus the small packages allow for closer placement to signal sources thereby reducing noise pickup.

The single LMV931 is offered in space saving SC70−5 package. The dual LMV932 is in either a Micro8 or SOIC package. These small packages are very beneficial for crowded PCB's.

V_{IDR}	Input Differential Voltage	$\pm$ Supply Voltage	V
V_{ICR}	Input Common Mode Voltage Range	−0.5 to (V_{CC}) + 0.5	V
	Maximum Input Current	10	mA
t_{So}	Output Short Circuit (Note 1)	Continuous	
T_J	Maximum Junction Temperature (Operating Range −40°C to 85°C)	150	°C
θ_{JA}	Thermal Resistance: SC−70 TSOP−5 Micro8	280 333 238	°C/W
T_{stg}	Storage Temperature	−65 to 150	°C
	Mounting Temperature (Infrared or Convection $\leq$ 30 sec)	260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.
ESD data available upon request.

1. Continuous short−circuit operation to ground at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C. Output currents in excess of 45 mA over long term may adversely affect reliability. Shorting output to either V_{CC} or V_{EE} will adversely affect reliability.

$$CO = 10\,C$$
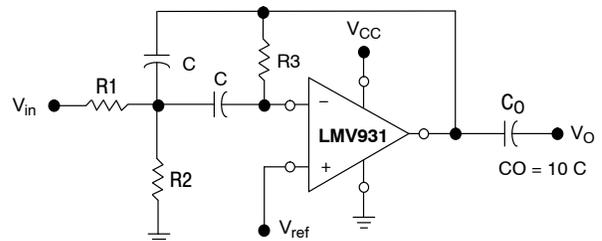

Given: f_o = center frequency
$A(f_o)$ = gain at center frequency

Choose value f_o, C

Then : $R3 = \dfrac{Q}{\pi f_O C}$

$R1 = \dfrac{R3}{2\,A(f_O)}$

$R2 = \dfrac{R1\,R3}{4Q^2\,R1 - R3}$

For less than 10% error from operational amplifier, $((Q_O f_O)/BW) < 0.1$ where f_o and BW are expressed in Hz. If source impedance varies, filter may be preceded with voltage follower buffer to stabilize filter parameters.
